Key to Families of Vascular Plants

APPENDIX

Key to Groups

1.							but reproducing by spores (FERNS AND FERN ALLIES	
1' Plants reproducing by seeds; spores produced but retained in ovules or shed as pollen gra						grains.		
	2.	fles	shy o	cone	s or b	orne na	xternal environment at the time of pollination; seeds producted at the ends of stalks or on the edges of reduced modif NOSPERMS; /ACROGYMNOSPERMAE).	ied leaves; carpels
	2′						vary at the time of pollination; seeds borne in fleshy or dry ue (/ANGIOSPERMAE).	fruits derived
		3.	nite pin	e in a	numb ly or j	er; sten palmat	rarely 1 or more than 2); flower parts <i>usually</i> in whorls of ans <i>usually</i> increasing in diameter through secondary growthely veined; roots el all secondary, a well-developed taproot DICOTYLEDONS).	h; leaves usually
			4.	•		•	carpous, composed of 2 or more distinct carpels (flower w	
			4 ′	Gy	noeci	um mo	nocarpous (of 1 carpel) or syncarpous (of 2 or more conna	te carpels).
				5.			sent or represented by a single whorl that is <i>usually</i> treated bid in appearance.	as sepals even
					6. l	Plants o	lefinitely woody	KEY 4 —p. 550
					6′ l	Plants l	nerbaceous or only slightly woody at the base	KEY 5 —p. 555
				5′		•	presented by two or more whorls or complete spirals, the or epals and the inner as petals.	ater generally
							listinct, at least at the base, falling individually or in pairs, or a tube.	never connate into
					8	8. Ov	ary superior; flowers hypogynous or perigynous.	
						9.	Number of stamens <i>more</i> than twice the number of petals.	
						9'	Number of stamens twice the number of petals or fewer.	
							10. Ovary 1-loculed	KEY 7 —p. 562
							10' Ovary two- to many-loculed.	KEY 8 —p. 564
					8	8' Ova	ary inferior or half-inferior; flowers epigynous	KEY 9 —p. 567

	Petals connate into a ring or tube, sometimes only at the base; the entire corolla falling as a single unit.
	11. Ovary or ovaries superior.
	12. Stamens equal the number of corolla lobes or more; corolla usually radial
	12' Stamens less than the number of corolla lobes; corolla usually bilateral
	11' Ovary partially or wholly inferior
3′	Cotyledon 1; flower parts <i>usually</i> in whorls of 3; stems <i>usually</i> not showing increase in diameter through secondary growth; leaves <i>usually</i> parallel veined; roots <i>usually</i> all secondary (/MONOCOTYLEDONEAE).
	12. Perianth present, well developed, often showy
	12' Perianth absent or very reduced, sometimes bristlelike or scalelike KEY 14 —p. 581

Key 1—Plants Reproducing by Spores (/Monilophyta; Ferns and Fern Allies)

1.	Le	aves	one	-vei	ned,	linear to oblong or scalelike or completely absent.	
	2 Plants free-floating or stranded on mud, very small						
	2'	Pla	ants	not f	float	ing, epiphytic or anchored in wet to dry soil.	
		3.				parently absent or reduced to veinless scales; roots absent; stems elongate, slender, usly branched with scattered 3-lobed sporangia/PSILOTACEAE—p. 158	
		3'	Le	aves	and	roots present; sporangia not borne on naked dichotomous stems.	
			4.	Le	aves	all basal, linear.	
				5.		ants with creeping rhizomes, often bearing swollen sporocarps; leaves with circinate rnation	
				5′	Pla	ants with cormlike bases, never rhizomatous; leaves never circinate.	
			4 ′	Le	aves	cauline, scalelike.	
				6.		ems hollow, jointed, with connate whorled scale leaves; sporangia borne on the underface of peltate sporangiophores in terminal cones / <i>EQUISETUM</i> —p. 160	
				6′		ems solid, not jointed; leaves alternate or opposite; sporangia borne in axils of fertile ves (sporophylls), often aggregated into conelike groups.	
					7.	Sporangia all similar, producing only one kind of spore; ligule absent/LYCOPODIACEAE—p. 158	
					7′	Sporangia of two kinds, some producing 4 megaspores, others producing numerous microspores; ligule present in leaf axils but often extremely small and difficult to observe	
1′	Le	aves	wit	h nu	mer	ous veins, well developed, entire to several times compound.	
	8.	Pla	ants	aqua	atic,	either rooting or free-floating.	
		9.	Le	aves	pin	nately divided or 1×–4× pinnate	
		9′	Le	aves	pal	mate with 4 leaflets	
	8′	Pla	ants	terre	estria	al or epiphytic, always rooted.	
		10				ongly dimorphic, the fertile fronds or fertile portions of the fronds sharply different erile fronds or portions of the fronds.	
						leaves linear, grasslike without expanded blades SCHIZAEACEAE —p. 161 leaves with expanded, often lobed or compound blades.	
						aves indeterminate with twining rachisesLYGODIACEAE—p. 161 aves determinate, never twining.	
					13	Sporangia 0.5–1 mm diameter, spherical. or pear-shaped, sessile.	
						14. Sporangia pear-shaped, ca. 0.5 mm diameter; annulus present, subapical, forming a complete ring around the sporangium; sporangia borne in long-stalked clusters, these either arising in pairs below the sterile portion of the frond or on slender fertile fronds completely separate from the sterile fronds.	

14' Sporangia spherical, 0.5–1 mm diameter; annulus absent; sporangia borne variously—in stalked clusters arising singly from the bases of sterile portion of the fronds, on terminal fertile pinnae, on fertile pinnae placed between upper and lower sterile pinnae, or on stout fertile fronds completely separate from the sterile fronds. 15. Fronds mostly solitary, generally 1–40 cm long, arising from a short stem with a fascicle of fleshy roots; sporangia in a spikelike or paniclelike cluster on a specialized stalk arising from the petiole below the sterile portion of 15' Fronds densely clustered, mostly 0.5–1.5 m long, arising in a dense rosette from a stout rhizome with slender, fibrous roots; sporangia borne on terminal fertile pinnae, on fertile pinnae placed between upper and lower sterile pinnae, or on stout fertile fronds completely separate from the sterile fronds.**OSMUNDACEAE**—p. 161 13' Sporangia much smaller, generally stalked. 16. Sori marginal, borne beneath curled margin of frond.**PTERIDACEAE**—p. 164 16' Sori borne away from margin on undersurface of frond. 17. Sori narrowly linear.BLECHNACEAE—p. 164 10' Leaves not at all or only weakly dimorphic, the fertile fronds or fertile portions of the fronds more or less similar to the sterile fronds or portions of the fronds. 18. Plants with a definite trunk; trees with very large 2x–4x pinnate leaves; annulus oblique to the stalk, forming a complete ring around the sporangium. 19. Sori borne on the undersurface of the leaflets in forks of the veins. 19' Sori borne on the leaf margins at the ends of veins. . . DICKSONIACEAE—p. 162 18' Plants with short to elongated rhizomes, but not forming a trunk; epiphytic or terrestrial herbs with simple to variously compound leaves; annulus vertical or absent, not forming a complete ring around the sporangium. 20. Leaves very thin, typically only a single cell layer thick between the veins. 20' Leaves thicker, generally several cells thick. 21. Sori borne along margins of leaf segments, the leaf margin generally revolute or with reflexed segments. 22. Stout ferns, 3–30 dm tall; petioles grooved, greenish or more or less strawcolored; rhizomes elongated, long-creeping; leaf bases with slender hairs but without scales.DENNSTAEDTIACEAE—p. 163 22' Slender ferns, mostly 1–5 dm tall, petioles terete, often dark brown or black; rhizomes short to moderately elongated, generally not long-creeping; leaf bases generally with scales, sometimes also hairy.**PTERIDACEAE**—p. 164 21' Sori borne away from margin on undersurface of frond (go to 23—next page).

23.	Sor	i without indusia.
	24.	Sporangia distributed across undersurface of frondPTERIDACEAE—p. 164
	24′	Sporangia in discrete sod.
		25. Leaves simple, entire or pinnately lobed; without needlelike or stellate hairs
		25' Leaves 1-2 times pinnate, with needlelike or stellate hairs
23'	Sor	i with indusia.
	26.	Sori elongated; indusia attached laterally.
		27. Sori one on each side of midvein of leaf or leaf segments or in chainlike rows parallel to midvein.
		28. Leaves linear, entireVITTARIACEAE—p. 164
		28' Leaves pinnately lobed or compound
		27' Sori not in chainlike rows, angled away from midvein along lateral veinlets.
		29. Scales of stems and petiole bases with ladderlike cross partitions; sporangial stalks 1 cell thick
		29' Scales of stems and petiole bases without ladderlike cross partitions; sporangial stalks 2–3-cells thickDRYOPTERIDACEAE—p. 164
	26′	Sori more or less round to reniform; indusia variously attached.
		30. Leaves with needlelike or stellate hairs
		30' Leaves without needlelike or stellate hairs, often scaly

Key 2—Plants Reproducing by Seeds Not Enclosed in Carpels—Gymnosperms

1.	Leaves pinnately compound.								
	2.	. Ovules borne on margins of leaflike sporophylls with pinnately lobed terminal segments.							
		•			CYCADACEAE—p. 188				
	2'	Ov	ules	boı	ne in conelike strobili				
1'	Lea	aves	sim	ple.					
3. Leaves 2, large, strap-shaped, leathery, persisting throughout life of plant; plants taprooted pere als without aerial leafy stems									
	3′		aves fy st		ny, small to large, variously shaped, mostly deciduous in age; mostly shrubs or trees with s.				
		4.	Ov	ules	borne in woody cones.				
			5.	Co	ne scales free from subtending bracts or nearly so				
			5′	Co	ne scales adnate to subtending bracts, sometimes with apices free.				
				6.	Ovules 2-many per cone scale				
				6′	Ovule 1 per cone scale, free and winged or embedded in cone scale and wingless.				
		4′	Ov	ules	naked or enclosed in a fleshy cone or surrounded by a cluster of perianthlike scales.				
			7.		ems jointed, green; leaves small, dry,opposite or whorled; ovules surrounded by a cluster perianthlike scales				
			7′	Ste	ems not jointed; leaves small to large.				
				8. Leaves pinnately veined with netted veinlets					
				8'	Leaves with parallel or dichotomous venation; veinlets not netted, often absent.				
					9. Leaf venation dichotomous; leaf blades petiolate, fan-shaped/GINKGO—p. 188				
					9' Leaf venation parallel or only one vein present.				
					10. Leaves and branchlets opposite or whorled.				
					11. Seeds 1–3, enclosed in fleshy berrylike cones.				
					11' Seeds 1-3 on short stalks, subtended by a few scalelike bracts.				
					10' Leaves and branchlets alternate.				
					12. Seeds surrounded by or completely enclosed by a fleshy, often brightly colored aril; not associated with any sterile cone scales.				
					12' Seeds without an aril; surrounded by a fleshy cone scale, often subtended by or basally enclosed in a swollen structure derived from sterile cone scales.				

Key 3—Dicots with an Apocarpous Gynoecium, Pistils 2 or More per Flower

Perianth absent or represented by only one whorl of parts, generally treated as sepals even when petaloid in color and texture.							
2. Sepals absent; plants herbaceous; flowers in dense spikes	245						
2' Sepals present though sometimes small.							
3. Hypanthium present	276						
3' Hypanthium absent.							
4. Plants herbs or woody vines.							
5. Fruit a cluster of large berries up to 7 cm long; stems twining; leaves palmately compound	245						
5' Fruit a cluster of achenes or follicles, mostly less than 4 cm long; stems not twining leaves simple or variously compound							
4' Plants erect shrubs or trees.							
6. Flowers imperfect; inflorescence a dense spherical head PLATANACEAE—p	246						
6' Flowers perfect or imperfect, borne in open clusters.							
7. Sepals connate; filaments connate into a tube STERCULIACEAE —p	334						
7' Sepals distinct; filaments distinct.							
8. Fruit an aggregate of follicles; flowers 2.5 cm in diameter or larger	243						
8' Fruit a ring of berries; flowers smaller	365						
1' Perianth parts in two or more whorls or complete spirals, the outer series usually treated as sepals an the inner as petals.	1						
9. Plants aquatic; leaves large, peltate	246						
9' Plants terrestrial; leaves not peltate.	•						
10. Stamens twice as many as the number of petals or fewer.							
11. Petals connate, at least at the base.							
12. Carpels 4 or more; leaves succulent; sap clear	270						
12' Carpels 2; sap usually milky.							
13. Styles distinct but stigmas connate and adnate to anthers forming a drum-shaped gynostegium							
	13' Styles distinct or connate; stigmas connate but free from stamens; anthers sometimes connivent around the styles						
11' Petals distinct.							
14. Leaves and often stems thick and fleshy	270						
14' Leaves and stems not very thick and fleshy.							
15. Leaves punctate; herbage often aromatic	282						
15' Leaves not punctate; herbage not aromatic (go to 16—next page).							

16. Hypanthium present.
17. Ovules mostly 1–2 per carpel; leaves simple or compound, usually stipulate, usually pinnately veined
17' Ovules several to many in each carpel; leaves simple, usually not stipulate, usually palmately veined
16' Hypanthium absent.
18. Leaves simple.
19. Branches essentially leafless, forming rigid green thorns.
SIMAROUBACEAE—p. 282
19' Branches leafy, not at all thorny.
20. Leaves opposite
20' Leaves alternate
18' Leaves compound.
21. Plants herbaceousLIMNANTHACEAE—p. 281
21' Plants woody
10' Stamens more than twice as many as petals or petaloid perianth elements or more than 15.
22. Leaves and often stems thick and fleshy
22' Leaves and stems not thick and fleshy.
23. Plants herbaceous or only slightly woody at base.
24. Hypanthium present
24' Hypanthium absent.
25. Sepals enlarging and persisting around the fruits; stamens maturing centrifugally.
25' Sepals caducous or withering as fruits mature.
26. Sepals 4–many, present at anthesis, often petaloid.
26' Sepals 2–3, falling as the flower opens, not petaloid
23' Plants definitely woody, shrubs or trees.
27. Crushed herbage strongly aromatic.
28. Leaves opposite
28' Leaves alternate
27' Crushed herbage not aromatic.
Ç .
29. Hypanthium present.
30. Stipules usually present; leaves mostly toothed, lobed or compound; seeds without an aril
30' Stipules present; leaves entire or tridentate at apex; seeds with an aril

29' Hypanthium absent.
31. Fruit a fleshy aggregate of berries
31' Fruit a dry aggregate of follicles, samaras or achenes.
32. Leaves compound
32' Leaves simple.
33. Pistils spirally attached to an elongated receptacle
33' Pistils whorled; receptacle not elongated

Key 4—Woody Dicots with Apetalous Flowers; Pistil 1 per Flower

1.	Arı	rang	eme	nt o	f flo	wers	s, at	least the staminate, in catkins or catkinlike spikes.
	2.							ping jointed branchlets resembling pine needles; leaves reduced to minute
	2'	Tre	es o	r sh	rubs	wit	h or	dinary branches and leaves; leaves alternate or opposite.
		3.	Pla	nt a	fles	hy s	ubsh	rub with succulent linear to oblanceolate or scalelike leaves; catkins erect.
			4.	Lea	aves	stip	ulate	e; ovary 4-locular
			4 ′	Lea	aves	esti	pula	te; ovary 1-locular
		3'	Pla	nt a	n or	dina	ry sł	nrub or tree.
			5.	Lea	aves	opp	osite	e
			5′	Lea	aves	alte	rnat	2.
				6.	Lea	aves	con	poundJUGLANDACEAE—p. 278
				6′	Lea	aves	sim	ple.
					7.			capsule with several to many comose seeds; flowers subtended by minute or fringed bractlets
					7′	Fru	ıit oı	ne-seeded, dry or fleshy; seeds not comose; bractlets, if present, not fringed.
						8.	Fru	its fleshy.
							9.	Sap milky.
								10. Pistillate inflorescence ripening as an ellipsoid to globose multiple fruit
								10' Pistillate flowers solitary; ovary ripening as a drupeEUPHORBIACEAE—p. 273
							9′	Sap clear; ripened pistillate inflorescence with small distinct drupes
						8′	Fru	its dry.
							11.	Fruit <i>either</i> a nut subtended by a cuplike involucre of numerous small scaly bractlets or 1–3 nuts surrounded by a burlike involucre of long, stiff, hardened bractlets; staminate catkins stiff and spikelike, <i>or</i> short and headlike, <i>or</i> very slender and drooping; bractlets of catkins inconspicuous.
							11'	Fruit a nut or nutlet subtended or surrounded by a leafy involucre or by an enlarged catkin scale <i>or</i> many small samaras in a conelike pistillate catkin; staminate catkins densely flowered, drooping at anthesis; bractlets of the catkins well developed, more or less concealing the flowers.
1′	Arı	rano	eme	nt of	f flo	wer	s var	ious, but not in catkins.
-		_					sent	
	14.					•		ikes or racemes, perfect or imperfect; stamens 1–10; ovary 1-loculed; sap
		13.					•	

1'

	13′	Flowers in cyathia, imperfect, with a solitary naked pistillate flower surrounded by several staminate flowers, each consisting of only one stamen on a jointed pedicel, the whole cluster surrounded by an involucre bearing one or more nectaries; ovary usually 3-loculed; sap milky.
12′	Per	ianth present, consisting of a greenish or petaloid calyx.
	14.	Inflorescence (at least of the pistillate flowers) a dense spherical head or a dense spike, or flowers on the inside of a hollow receptacle.
		15. Fruits or fruit-clusters dry.
		16. Stipules conspicuous, sheathing; fruit a dense spherical cluster of achenes
		16' Stipules inconspicuous distinct; fruits distinct.
		17. Leaves palmately lobed; fruits capsular, in dense spherical clusters
		17' Leaves bipinnate or reduced to entire simple phyllodes (flattened petioles without leaflets); fruit a legume
		15' Fruit clusters fleshy; fruits coalescent into a multiple fruitMORACEAE—p. 276
	14'	Inflorescence not a spherical head.
		18. Plants parasitic on the branches of trees and shrubs and not connected to the ground.
		18' Plants not parasitic, normally rooted in the ground.
		19. Ovary wholly or partly inferior (or appearing so).
		20. Foliage and young branches scurfy with peltate or stellate scales.
		21. Carpel and ovule 1; flowers solitary or in axillary clusters
		21' Carpels and ovules 2-several; flowers in umbels
		20' Foliage and branches never scurfy.
		22. Plants climbing, vines.
		23. Flowers surrounded by showy bractsNYCTAGINACEAE—p. 365
		23' Flowers bractless or subtended by inconspicuous greenish bracts
		22' Plants erect, shrubs or trees.
		24. Style 1; trees or shrubs with entire leaves.
		25. Stamens 5-10; fruit fleshy.
		26. Stamens 10; fruit a drupeCOMBRETACEAE—p. 279
		26' Stamens 5; fruit a berry
		25' Stamens many; fruit a woody capsuleMYRTACEAE—p. 279
		24' Styles 2 or style 2-lobed; deciduous shrubs with lobed or dentate leaves; fruit a berry
		19' Ovary superior (go to 27—next page).

27. Leaves opposite or whorled.							
28. Leaves whorled							
28' Leaves opposite.							
29. Fruit a samara; leaves usually lobed or compound.							
30. Samara 1-loculed; wing single; leaves pinnately compound or rarely simple							
30' Samara 2-loculed; wing double; leaves palmately lobed or occasionally compound							
29' Fruit not winged; leaves simple and entire.							
31. Locules of ovary 3.							
32. Ovules 2 per locule							
32' Ovule 1 per locule							
31' Locules of ovary 1-2, with 1 ovule per locule.							
33. Leaf strongly 3-veined from base LAURACEAE—p. 244							
33' Leaf with one main vein.							
34. Flowers minute, inconspicuousOLEACEAE—p. 373							
34' Flowers large, showy.							
35. Ovules several to many LYTHRACEAE—p. 279							
35' Ovules 1 or 2.							
36. Plant a mesophytic shrub with broad thin leaves							
36' Plant an intricately branched desert shrub with narrow fascicled leaves							
27' Leaves alternate.							
37. Leaves compound.							
38. Leaf even-pinnate; leaflets 4–8.							
39. Fruit a leathery indehiscent legume; leaflets obtuse							
39' Fruit fleshy; leaflets acute							
38' Leaf odd-pinnate; leaflets 3–11.							
40. Leaflets 3; flowers white-tomentose; stamens 10EUPHORBIACEAE—p. 273							
40' Leaflets 3–11; flowers brownish-green; stamens 5							
37' Leaves simple, sometimes lobed.							
41. Anthers opening by pores; herbage usually aromatic							
41' Anthers opening by slits (go to 42—next page).							

42. Ovules several per locule.
43. Locule of ovary 1.
44. Stamens numerous; trees or shrubs.
44' Stamens 4–5; woody vines
43' Locules of ovary 2–8; stamens monadelphousSTERCULIACEAE—p. 334
42' Ovules 1–2 per locule.
45. Locules of ovary 2–9.
46. Stamens as many as and alternate with the sepals
46' Stamens opposite the sepals or more numerous.
47. Locules of ovary 6–9; fruit a berry; plants small, prostrate
47' Locules of ovary 2–4.
48. Ovules bent upward and inward with the raphe toward the axis of the ovary; sap often milky; fruit a capsule or a berry
48' Ovules bent downward with the raphe away from the axis of the ovary; sap clear; fruit a drupe or a capsule
45' Locule of ovary 1.
49. Style or stigmas 2–4.
50. Flowers perfect.
51. Fruit an orbicular to ovate disclike samara; trees
51' Fruit an achene or a utricle; low shrubs or woody vines.
52. Flowers several to many in a calyxlike involucre
52' Flowers bractless or subtended by solitary bractsCHENOPODIACEAE—p. 365
50' Flowers imperfect.
53. Fruit a drupe, nut or samara, not enclosed by bracts
53' Fruit an achene, enclosed by 2 persistent bracts
49' Style or stigma 1.
54. Calyx with long cylindrical tube, often swollen at base.
55. Flowers bilateral

	55 ′	Flowers radial NYCTAGINACEAE —p. 365
54 ′	Cal	yx not tubular or if so, the tube quite short.
	56.	Style in fruit plumose; ovary often surrounded by a tubular hypanthium
	56′	Style not plumose; ovary not surrounded by a hypanthium.
		57. Stamens 4
		57' Stamens 8 or 10THYMELAEACEAE—p. 282

Key 5—Herbaceous Dicots with Perianth Absent or Represented by a Single Whorl

1.

	Landa of man 2 man				
	Locules of ovary 2 or more.				
2.		Fruit breaking apart into mericarps or nutlets.			
	3.	Plants aquatic, submersed or stranded on mud.			
		4. Flowers in simple or compound umbels	9		
		4' Flowers axillary or in spikes.			
		5. Leaves pinnately dissected	1		
		5' Leaves entire	6		
	3′	Plants terrestrial.			
		6. Mericarps dehiscent; sap often milky	3		
		6' Mericarps indehiscent; sap never milky.			
		7. Perianth parts 5, distinct; flowers in compound umbels	9		
		7' Perianth parts 4, connate	2		
2'	Fr	it a berry or a capsule.			
	8.	Flowers in erect catkinlike spikes	1		
	8'	Flowers solitary or variously clustered but not in catkinlike spikes.			
		9. Ovary inferior.			
		10. Plants aquatic	9		
		10' Plants terrestrial.			
		11. Flowers imperfect.			
		12. Tendrils usually present; perianth parts fused CUCURBITACEAE—p. 277	7		
		12' Tendrils absent; perianth parts distinctBEGONIACEAE—p. 27'	7		
		11' Flowers perfect.			
		13. Leaves deeply cordate, glabrous or soft pubescent.	_		
		13' Leaves truncate, covered with water-filled vescicles AIZOACEAE—p. 365 9' Ovary superior.	J		
		3 1	n		
		14. Plant red and white striped; green pigment absent	7		
		15. Flowers perfect; ovary 3- to many-loculed.			
			6		
		16. Leaves deeply dissected into linear segments RANUNCULACEAE —p. 246	J		
		16' Leaves entire.			
		17. Fruit a flattened berry; flowers in elongated terminal racemesPHYTOLACCACEAE—p. 365	5		
		17' Fruit a capsule; flowers axillary or in short, dense clusters; plants low-growing, frequently prostrate (go to 18—next page).			

18. Leaves alternate or opposite; capsule circumscissile
18' Leaves apparently whorled; capsule splitting lengthwise, loculicidal
15' Flowers imperfect; ovary 2–3-loculed.
19. Fruit a schizocarpic capsule; sap often milky; flowers sometimes very reduced and clustered into cyathia
19' Fruit a drupe; sap clear; flowers never in cyathia
20. Ovules several to many.
21. Plants tiny internal parasites on stems of leguminous shrubs RAFFLESIACEAE—p. 273
21' Plants free-living or root-parasites.
22. Ovary inferior.
23. Inflorescence subtended by conspicuous petaloid bracts SAURURACEAE—p. 245
23' Inflorescence without petaloid bracts.
24. Leaves entire, linear to oblong
24' Leaves pinnately dissected
22' Ovary superior.
25. Leaves estipulate.
26. Placentation parietal
26' Placentation free-central.
27. Leaves opposite.
28. Flowers sessile; sepals petaloid
28' Flowers pedicelled, minute; sepals green.
27' Leaves alternate
25' Leaves stipulate.
29. Capsule dehiscing by terminal teeth or valves CARYOPHYLLACEAE—p. 364
29' Capsule circumscissile
20' Ovule 1.
30. Leaves enormous, more than 50 cm wide
30' Leaves much smaller.
31. Style 1, undivided or stigma I and sessile.
32. Plants submersed aquatics.
33. Leaves repeatedly forked
33' Leaves entire
32' Plants terrestrial (go to 34—next page).

34. Stigma sessile.
35. Calyx present
35' Calyx absent.
36. Leaves palmately compound; fruit dry, 3–5 mm long
36' Leaves simple; fruit fleshy, smaller
34' Stigma terminating a slender style.
37. Leaves deeply lobed or compound.
38. Tendrils present
38' Tendrils absent
37' Leaves simple, unlobed, entire or variously toothed.
39. Calyx petaloid, the basal portion tightly enwrapping the ovary
39' Calyx, if present, not at all petaloid; stinging hairs often present.
40. Plants densely stellate-pubescent; stems prostrateEUPHORBIACEAE—p. 273
40' Plants glabrous or pubescent but not stellate; stems often erect
31' Styles, style-branches or stigmas 2 or more.
41. Flowers subtended by a well-developed involucre.
42. Flowers tubular with 5 (rarely 4) showy perianth parts; ray flowers sometimes present; ovary inferior
42' Flowers often not tubular; perianth parts 6; ray flowers never present; ovary superior
41' Flowers not subtended by an involucre.
43. Leaves deeply palmately lobed or palmately compound
43' Leaves simple, entire to dentate or shallowly hastate.
44. Fruit a triangular achene; sepals 6 in two often dissimilar whorls or 5 and uniseriate, frequently more or less brightly colored and showy; leaves often with sheathing stipules (ocreae) and swollen nodes.
44' Fruit a biconvex achene, a circumscissile capsule or a utricle; sepals 3–5, often greenish or calyx absent.
45. Leaves stipulate.
46. Stipules united forming an ocrea; leaves alternate or all basal
46' Stipules distinct; leaves opposite, but one of each pair of leaves often larger than the other
45' Leaves estipulate (go to 47—next page).

- 47' Plants not mealy or fleshy; plants mostly not of saline habitats; bracts subtending flowers dry and scarious. . . **AMARANTHACEAE**—p. 365

Key 6—Dicots with Distinct Petals, Many Stamens, and a Superior Ovary

1.

1′

Ov	ary	1-lo	cule	ed.				
2.	Ovule 1 or 2 per ovary, fruit a drupe, berry, one-seeded follicle or achene.							
	3.	Flo	wer	rs 3-merous.				
		4.	Fru	uit a triangular achene	. 367			
		4 ′	Fru	uit a berry or a drupe	. 244			
	3'	Flo	wer	rs 5-merous	. 276			
2'								
	5.	Foliage densely stipitate-glandular.						
		6.		ant a low herb with simple leaves; hairs often insect-trapping; flowers small, 5-merous				
		6′		ant an erect herb with palmately compound leaves; hairs not insect-trapping; flowers owy, 4-merous	. 280			
	5 ′	Fol	liage	e glabrous to densely pubescent but not densely glandular.				
		7.	Flo	owers in racemes, spikes or heads.				
			8.	Plants herbaceous, 1–2.5 m tall; leaves ternately decompound; fruit a follicle.	. 246			
			8′	Plants woody, or if herbaceous, smaller; leaves simple to bipinnate; fruit a capsule o legume.	r a			
				9. Stamens all attached on one side of flower; fruit an ovoid, apically dehiscent capsule	. 281			
				9' Stamens uniformly attached around the flower; fruit a legume	. 275			
		7′	Flo	owers solitary or in cymose or paniculiform clusters.				
			10.	. Fruit a follicle; flowers with a hypanthium	. 276			
			10′	' Fruit a capsule; flowers usually without a hypanthium.				
				11. Sepals caducous, usually 2 or 3, sometimes united to the tip into a conical cap at deciduous as a unit; sap (at least in the roots) usually milky or colored.				
					. 246			
				11' Sepals persistent, 2–6, never united to the tip; sap clear.				
				12. Stamens basally united into 5 bunches	. 274			
				12' Stamens distinct to the base.				
				13. Styles 3–8, united only at the base; plants often somewhat succulent.	. 365			
				13' Style 1, sometimes divided at the tip; plants not at all succulent	. 281			
Ov	ary	2–m	any	r-loculed.				
1/	Ιρ	9V/AC	hol	llow tubular often water-filled SARRACENIACEAE_n	370			

Leaves with ordinary flat blades.
15. Plants aquatic; leaves large, ovate to orbicular, floating or emersed.
15' Plants terrestrial.
16. Flowers imperfect; ovary (2–) 3- (–4) lobedEUPHORBIACEAE—p. 273
16' Flowers perfect.
17. Stamens monadelphous.
18. Petals 8–12 in 2 series
18' Petals 5 (or sometimes more in "double" flowers).
19. Anthers 1-loculed with a single crescent-shaped pollen sac.
19' Anthers 2-loculed
17' Stamens distinct or united basally in groups.
20. Hypanthium present.
21. Style 1. 22. Ovvilag several to many per leavel. LVTID ACE AE = 270.
22. Ovules several to many per locule
21' Styles 2 or more
20' Hypanthium absent.
23. Fruit fleshy.
24. Ovary maturing as a ring of 3–10 black drupes surrounding a bright red
receptacle; flowers yellow
24' Ovary maturing as a berry.
25. Style 1, unbranched; exocarp leathery, fruit a hesperidium
25' Styles or style-branches 3-many; exocarp thin, sometimes coarsely hairy
23' Fruit dry at maturity.
26. Leaves opposite
26' Leaves alternate.
27. Stipules present though sometimes small and deciduous.
28. Anthers opening by terminal pores.
ELAEOCARPACEAE—p. 275
28' Anthers opening by lateral slits
27' Stipules absent.
29. Sepals deciduous as flower opens
29' Sepals present in open flowers.
30. Plants herbaceous

14'

30' Plants woody.

- 31' Anthers erect, dehiscing by longitudinal slits.
 - 32. Stipules present. . . . **DIPTEROCARPACEAE**—p. 282

Key 7—Dicots with Two or More Whorls of Distinct Perianth Parts and a Superior One-Loculed Ovary

Ovule 1.					
2. Filaments of all 10 stamens connate into a tube around the ovary or 9 connate and 1 distinct; fruit a one-seeded legume					
2' Filaments of all stamens distinct.					
3. Hypanthium present, well developed					
3' Hypanthium absent or scarcely developed.					
4. Sepals 3–4.					
5. Perianth 3-merous					
5' Perianth 4-merous					
4' Sepals or calyx lobes 5 or more.					
6. Calyx tubular, more or less glandular pubescent, often scarious.					
6' Calyx shallow and disclike to campanulate.					
7. Herbage densely stellate canescent; plants herbaceous.					
EUPHORBIACEAE—p. 273					
7' Herbage glabrous to pilose but never stellate; plants woody					
Ovules 2-many.					
8. Fruit breaking transversely into one-seeded joints.					
9. Corolla strongly bilateral; petals 5; stamens monadelphous or diadelphous.					
9' Corolla radial; petals 4; stamens distinct, tetradynamous					
8' Fruit fleshy and indehiscent or dry and regularly dehiscent.					
10. Placentation free central or basal.					
11. Corolla of 2 or more series of petals; anthers often poricidal by uplifted valves					
11' Corolla of a single series of petals; anthers longitudinally dehiscent.					
12. Leaves reduced to tiny scales					
12' Leaves with well-developed blades.					
13. Sepals 2 (rarely more); leaves often succulent PORTULACACEAE —p. 365					
13' Sepals 5, distinct or united; leaves seldom succulent.					
14. Styles or style branches 2–5					
14' Style 1, undivided.					
15. Hypanthium absent					

1.

1'

15' Hypanthium presentLYTHRACEAE—p. 279
10' Placentation marginal or parietal.
16. Style 1, unbranched, or stigma solitary and sessile.
17. Placentation marginal; the ovary simple.
18. Sepals 12–15; petals 6
18' Sepals 4–5; petals 4–5.
19. Petals 4
19' Petals 5.
20. Fruit a drupe
20' Fruit dry at maturity.
21. Stamens 4; fruit a spiny pod; leaves always simple.
21' Stamens (5–) 10; fruit a legume, usually not spiny; leaves compound
17' Placentation parietal, the ovary compound.
22. Corolla with one or more spurred or saccate petals.
23. Petals 5, sepals 5
23' Petals 4, sepals 2
22' Corolla without spurred petals.
24. Capsule hard, woody; trees or shrubs with simple leaves.
PITTOSPORACEAE—p. 379
24' Capsule not woody; herbs or shrubs with simple or palmately compound leaves.
25. Flowers solitary on long slender peduncles PAPAVERACEAE —p. 246
25' Flowers in elongated racemes
16' Styles or style branches 2–several or stigmas several and sessile.
26. Plants climbing by means of tendrils; flowers with a fringed corona. PASSIFLORACEAE—p. 274
26' Plants without tendrils.
27. Foliage bearing long, slender, gland-tipped insect-trapping hairs.
DROSERACEAE—p. 367
27' Foliage not glandular.
28. Leaves opposite or appearing to be whorled FRANKENIACEAE—p. 366
28' Leaves alternate (or rarely opposite and basal).
29. Stamens hypogynous; flowers bilateral; leaves narrowly linear to lanceolate and pinnately parted
29' Stamens perigynous; flowers usually radial; leaves mostly broader, often shallowly palmately lobed

Key 8—Dicots with Distinct Petals, Few Stamens, and a Superior Two- to Many-Loculed Ovary

Ov	Ovules 1 or 2 per locule.				
2.	Styles 3–5 or style 3–5 branched from below the middle.				
	3. Fruit a drupe with 1 or 2 seeds	-p. 282			
	3' Fruit dry, dehiscent.				
	4. Petals shorter than sepals, very inconspicuous; ovary 3-lobed; styles 3.	272			
	EUPHORBIACEAE—	-p. 273			
	4' Petals usually longer than sepals, showy; ovary not much lobed; styles 5.	275			
	5. Leaves palmately compound	•			
	5' Leaves simple, entireLINACEAE—	-p. 274			
2′	Style 1, entire or divided above the middle, or ovary with a sessile stigma.				
	6. Fruit a samara with a well-developed wing.				
	7. Samara wing round	-p. 282			
	8. Petals 2; samara simple	-p. 373			
	8' Petals 4–6; samara double, 2-winged, 2-seeded	-p. 282			
	6' Fruit not winged.				
	9. Plants definitely woody; well-developed trees, shrubs or woody vines.				
	10. Stamens equal in number to the petals and opposite them.				
	11. Plants climbing by means of tendrils; leaves mostly palmately lobed or compo				
	11' Plants erect or decumbent shrubs without tendrils; leaves pinnately veined or times 3-veined from the base, never compound				
	10' Stamens alternate with petals or more numerous.				
	12. Herbage usually strongly scented, usually dotted with translucent oil glands.				
		-p. 282			
	12' Herbage not strongly scented, not gland-dotted.				
	13. Leaves compound				
	14. Leaves palmate	-p. 282			
	14' Leaves pinnate or bipinnate.				
	15. Stamens monadelphous; fruits drupaceous, persistent in large clus on the branches				
	15' Stamens distinct; fruits capsular, deciduous at maturitySAPINDACEAE—	-p. 282			

1.

13' Leaves simple.
16. Flowers with a well-developed disc around the ovary.
16' Flowers without a disc
9' Plants herbaceous or suffrutescent.
17. Herbage dotted with translucent oil glands
17' Herbage not gland-dotted.
18. Ovary locules 2.
19. Sepals 5; petals 3–5; flowers strongly bilateral POLYGALACEAE —p. 275
19' Sepals 4; petals 4; flowers radial or nearly so.
20. Fruit a pair of 1-seeded nutlets
20' Fruit a silicle or a siliqueBRASSICACEAE (CRUCIFERAE)—p. 280
18' Ovary locules 3–5:
21. Calyx spurred; leaves peltate
21' Calyx not spurred; leaves rarely peltate.
22. Stamens monadelphous
22' Stamens distinct or connate only at base.
23. Stipules absent
23' Stipules present.
24. Styles elongate, persistent as coiled beaks on the ripened carpels.
24' Styles short, not forming coiled beaks when carpels separateZYGOPHYLLACEAE—p. 272
1' Ovules 3-many per locule.
25. Petals inserted on a well-developed hypanthium.
26. Styles 2–3
26' Style 1.
27. Anthers elongate, one-loculed, opening by a terminal pore.
27' Anthers short, 2-loculed, opening by longitudinal slits LYTHRACEAE—p. 279 25' Petals attached to the receptacle.
28. Calyx spurred or saccate.
29. Leaves large, pinnately compound; flowers in elongated racemes.
29' Leaves smaller, simple; flowers solitary or in small clustersBALSAMINACEAE—p. 369

′	Calyx not spurred or saccate.				
	0. Plants definitely woody, trees or shrubs.				
	31. Leaves compound.				
	32. Stamens monadelphous; leaves alternateBOMBACOIDEAE—p. 335				
	32' Stamens distinct; leaves opposite				
	31' Leaves simple.				
	33. Leaves deeply bilobed, covered with a resinous exudate; xerophytic shrubZYGOPHYLLACEAE—p. 272				
	33' Leaves toothed or entire, not resinous; mesophytic shrubs or trees.				
	34. Leaf-blades palmately veined; flowers in racemes GREYIACEAE—p. 279				
	34' Leaf-blades pinnately veined.				
	35. Flowers solitary or in rounded clusters PITTOSPORACEAE —p. 379				
	35' Flowers in racemes				
30' Plants herbaceous or only slightly woody subshrubs.					
36. Ovary locules 2; fruit a silicle or silique					
				37. Leaves opposite or whorled.	
	38. Herbs of aquatic or semiaquatic situations, often growing on mud-flats; capsules septicidal				
	38' Herbs of terrestrial situations; capsules opening by terminal valves				
	37' Leaves alternate or all basal.				
	39. Leaves palmately compound; plants always green and photosynthetic				
	39' Leaves simple; plants markedly mycotrophic, sometimes achlorophyllous and non-photosynthetic				

Key 9—Dicots with Distinct Petals and an Inferior Ovary

1.	Stamens numerous, more than twice as many as the petals or more than 15.				
	2.	St	yles	mor	re than 1, sometimes partly united.
		3.	Pla	ants	aquatic with floating or emergent leaves and flowers NYMPHAEACEAE —p. 242
		3'	Pla	ants	terrestrial.
			4.		owers imperfect; petals 2 in staminate flowers, 0 in pistillate flowers.
			4′	Flo	owers perfect; petals 4 or 5 to many.
				5.	Petals many; herbs or subshrubs, often succulent
				5′	Petals normally 4 or 5 (except in horticulturally "doubled" flowers); well-developed shrubs or trees.
					6. Leaves alternate; petals 5; fruit a pome
					6' Leaves opposite; petals usually 4; fruit a capsule HYDRANGEACEAE —p. 368
	2'	St	yle 1	l.	
	7. Sepals and petals indefinite in number and not sharply differentiated from each other; plants spiny, usually succulent			*	
		7′	Se	pals	and petals 3–7 in distinct series.
			8.	•	ecies of herbs or low shrubs with rough, barbed or stinging hairs.
					LOASACEAE—p. 368
			8'	Sp	ecies of trees or shrubs lacking such hairs.
				9.	Fruits fleshy.
					10. Seeds individually surrounded by sacs of juicy pulp, packed into superposed ovary locules (one above the other)
					10' Seeds dry (any pulpy tissue derived from ovary wall); locules not superposed.
					11. Leaves punctate, often strongly scented
					11' Leaves not punctate, not scented
				9'	Fruit dry.
					12. Leaves punctate
					12' Leaves not punctate
1'	Sta	ime	ns no	ot m	ore than twice as many as petals.
	13.	. Sty	yles	mor	re than 1, separate to base.
		14	. Pla	ant a	a submersed aquatic with dimorphic leaves
		14	' Pla	ant to	errestrial, or if aquatic, the leaves all similar.
			15	. Se	pals 2; plants fleshy; seeds numerous
			15	' Se	pals more than 2 or obscure.
				16	. Seeds many in each locule of ovary.
					17. Plants herbaceous

17' Plants woody.
18. Leaves opposite
18' Leaves alternate.
19. Locule 1; placentation parietal; fruit often a berry
19' Locules 2; placentation axile; fruit a woody capsule
16' Seeds 1 or 2 in each locule.
20. Fruit splitting into 2 indehiscent mericarps; styles 2; herbage usually aromatic; inflorescence a head or compound umbel.
20' Fruit not splitting into mericarps; plants mostly woody.21. Pubescence stellate; fruit a woody capsule; styles 2.
21' Pubescence not stellate, or if so the plant a vine or shrub with a fleshy fruit; styles 2–10.
22. Stamens 4–5, equal in number to the petals ARALIACEAE —p. 379
22' Stamens usually 10, more numerous than the petals (if fewer, plants with well-developed thorns).
23. Leaves opposite; fruit a capsule
23' Leaves alternate; fruit a pome
13' Style 1, sometimes branched above the middle, or stigma(s) sessile.
24. Stamens equal in number to petals and opposite them.
25. Plant terrestrial, free-living; hypanthium usually present; ovary locules 2 or more.
25' Plant parasitic on the branches of woody hosts; hypanthium absent; ovary one-loculed
24' Stamens alternate with the petals or sometimes of different number.
26. Plant a tendril-bearing vine, monoecious
26' Plants never tendril-bearing; flowers usually perfect.
27. Ovules more than 1 in each locule of ovary.
28. Leaves with 3–9 longitudinal veins and peculiar cross-venation, so as to be broken into many squarrish areolae
28' Leaves not so veined.
29. Locule of ovary 1; placentation apical or parietal.
30. Stamens twice as many as petals; placentation apical; ovules 2–6
30' Stamens as many as petals; placentation parietal; ovules several to many.
31. Plants woody

31' Plants herbaceous
29' Locules of ovary 2 or more; placentation axile.
32. Trees or shrubs with opposite (less commonly alternate) entire leaves; stipules present, well developed, attached to stem (but often deciduous); ovules seldom more than 2 per locule
32' Herbs or shrubs with alternate or opposite, often toothed or lobed leaves; stipules usually absent; ovules usually several to many per locule.
33. Locules 4
33' Locules 2
27' Ovule 1 in each locule of ovary or reduced to 1 in each ovary.
34. Sepals and petals 5
34' Sepals and petals 4 or 2.
35. Fruit dry, nut-like; plants herbaceous
35' Fruit a drupe; plants mostly woody

Key 10—Dicots with Petals United into a Ring or Tube, a Superior Overy, and a Radially Symmetric Corolla

1.	. Plants lacking green pigmentation, mycotrophic symbionts or root-parasites.			
	2.	Sle	nde	r twining leafless vines
	2'	Ere	ect f	leshy herbs with scalelike leaves.
		3.	Fil	aments adnate to corolla tube
		3.	Fil	aments free from corolla or nearly so
1′	Pla	nts	gree	n and photosynthetic
	4.	Sta	mer	as more numerous than corolla lobes.
		5.	Lo	cule of ovary 1.
			6.	Style generally off-center; placentation marginal; fruit a legume. FABACEAE (LEGUMINOSAE)—p. 275
			6 ′	Style arising from center of ovary; placentation parietal or basal.
			U	7. Fruit an achene; flower 3-merous
				7' Fruit a capsule; flowers 4–5 merous
			5′	Locules of ovary 2 to many.
			8.	Filaments connate, at least at base, sometimes forming a long tube.
				9. Stamens numerous; leaves usually palmately veined
				9' Stamens 10 or fewer; leaves various.
				10. Leaves compound, usually trifoliolate
				10' Leaves simple.
				11. Flowers bilateral; plants herbs or subshrubs
				11' Flowers radial; plants definitely woody, well developed trees or shrubs.
				12. Styles 2–5
				12' Style 1
			8′	Filaments distinct.
				13. Plants herbaceous or only slightly woody
				13' Plants definitely woody, well-developed trees or shrubs.
				14. Stems covered with large stiff petiolar spines FOUQUIERIACEAE—p. 369
				14' Stems unarmed.
				15. Anthers dehiscing by longitudinal slits
				15' Anther dehiscing by terminal pores.
				16. Petals generally connate most of their length ERICACEAE —p. 369
				16' Petals connate only at base

4 ′	Stamens as many as corolla lobes or fewer.
	17. Locule of ovary 1.
	18. Ovule 1, basal.
	19. Style 1, undivided
	19' Styles 3–5 or style 1 and 3–5 lobed.
	20. Styles or style branches 3; fleshy vines
	20' Styles or style branches 5; herbs or shrubs
	18' Ovules 2-many, parietal or free-central.
	21. Placentae free-central.
	22. Sepals 2
	22' Sepals 4–5.
	23. Plants herbaceous
	23' Plants woody
	21' Placentae parietal.
	24. Styles or style branches 2
	24' Style 1, undivided.
	25. Leaves usually opposite or whorled; fruit mostly capsular.
	25' Leaves alternate; fruit a berry
	17' Locules of ovary 2 or more or ovaries 2.
	•
	26. Ovary breaking apart into nutlets or one-carpellate pieces.27. Stems sharply quadrangular
	27' Stems terete.
	28. Flowers in scorpioid cymes
	28' Flowers solitary.
	29. Leaves reniform, thin
	29' Leaves narrow to broad, fleshyNOLANACEAE—p. 377
	26' Ovary ripening as a dehiscent capsule or as a berry or drupe or ovaries 2, ripening as
	follicles.
	30. Filaments attached to receptacle or slightly adherent to base of corolla.
	31. Anthers dehiscent by terminal pores, often bearing appendages.
	31' Anthers dehiscent by lateral slits, not appendaged AQUIFOLIACEAE—p. 380
	30' Filaments adnate to corolla throat or corolla tube.
	32 Tendrils present VITACEAE—p. 272

32' Tendrils absent. 33. Leaves alternate or of unusual arrangement. 34. Ovaries 2, distinct; stigmas connate and adnate to anthers.**ASCLEPIADACEAE**—p. 269 34' Ovary 1; stigmas free from anthers. Locules of ovary 3-many. 36. Stamens opposite the petals; ovule 1 per locule. 36' Stamens alternate with the petals; ovules 2–many per locule. 37' Stems erect to spreading. 38. Fruit a capsule or berry 1 cm or more in diameter; style undivided.**SOLANACEAE**—p. 377 38' Fruit a much smaller capsule; style usually 3-lobed.**POLEMONIACEAE**—p. 369 35' Locules of ovary 2. 39' Stems prostrate to erect but not twining. 40. Sepals usually connate; style 1, undivided. 41. Some or all the stamens bearing dense tufts of hair; corolla lobes imbricate in bud; flowers in spikes or racemes.**SCROPHULARIACEAE**—p. 377 41' Stamens glabrous or hairy only at base; corolla plicate or valvate in bud; flowers solitary or variously cymose. 40' Sepals distinct or nearly so; styles 2 or style 1 and 2-lobed. 42. Flowers solitary; plants usually twining or trailing; pedicels with a pair of bractlets; sap often milky. 42' Flowers usually in scorpioid cymes; stems never twining; pedicels not bracteolate; sap clear.**HYDROPHYLLACEAE**—p. 373 33' Leaves opposite or all basal.

- 43' Corolla of normal texture.
 - 44. Stipules present, sometimes reduced to a line joining the leaf bases.**LOGANIACEAE**—p. 372
 - 44' Stipules absent (or very reduced).
 - 45. Sap usually milky; ovaries often 2, joined by a common stigma.

46.	Stamens and stigma adnate forming a cylindrical gynostegium. ASCLEPIADACEAE—p. 373
46′	Stamens free from stigma or merely adherent
45. Sap	o clear.
47.	Style 1, 3-branched
47 ′	Style 1, entire or 2-lobed or styles 2.
	48. Leaves mostly toothed, lobed or compound; styles or style-branches 2
	48' Leaves entire; style unbranched.
	49. Petals with several veins from the baseSOLANACEAE—p. 377
	49' Petal with 1 main vein GENTIANACEAE —p. 372

Key 11—Dicots with Petals United into a Ring or Tube, a Superior Ovary, and a Bilaterally Symmetric Corolla

۱.				ing green pigmentation, mycotrophic symbionts or root-parasites.
				OROBANCHACEAE—p. 375
ľ			_	an and photosynthetic.
	2.			of ovary 1.
		3.		rule 1, apical
		3′		rules 2-many, parietal or free central.
			4.	Placentation free central; plants aquatic with finely divided leaves or terrestrial and leaves all entire and basal
			4 ′	Placentation parietal; plants terrestrial.
				5. Fruit with a hooked beak several cm long
				5' Fruit beakless.
				6. Plants herbaceous
				6' Plants woody, sometimes climbing; leaves often compound.
				7. Leaves sticky-glandular, simpleSCROPHULARIACEAE—p. 377
				7' Leaves not sticky-glandular, sometimes compound
	2'	Lo	cule	s of ovary 2 or more.
		8.	Fru	uit of 2-4 nutlets or drupelets, or a drupe with a bony, more or less lobed endocarp.
			9.	Ovary entire or shallowly lobed; style terminal.
				10. Leaves usually opposite or whorled
				10' Leaves usually alternate
			9′	Ovary deeply 4-lobed
		8'	Fru	uit a capsule or a berry.
			11.	. Fruit tipped with a hooked beak several cm long
			11	Fruit beakless or beak much shorter and straight.
				12. Leaves alternate.
				13. Lobes of corolla imbricate in bud; crushed herbage usually lacking rank odor.
				13' Lobes of corolla valvate or plicate in bud; crushed herbage usually ill-scented with very rank odor
				12' Leaves opposite, whorled or all basal.
				14. Corolla radial; stamens 2
				14' Corolla strongly to weakly bilateral; stamens 2 or 4.
				15. Plant a tree
				15' Plant a shrub, herb or woody vine.

16.	Leaves compound
16′	Leaves simple.
	17. Flowers individually subtended by a pair of bractlets
	17' Flowers bractless or subtended by only one bract.
	SCROPHULARIACEAE—p. 377

Key 12—Dicots with Petals United into a Ring or Tube and an Inferior Ovary

1. Anthers connate into a tube.		nnate into a tube.						
	2.	2. Ovule solitary, basal; flowers in involucrate heads ASTERACEAE (COMPOSITAE) —p. 378						
	2'	Ov	ules	1 to many; inflorescences various.				
		3.		wers perfect; corolla often strongly bilateral; tendrils absent				
		3′	Flo	wers imperfect; corolla usually radial; tendrils usually present				
1′	An	ther	s dis	tinct.				
	4.	Fila	amei	nts free from the corolla or only slightly adherent to base of corolla.				
		5.	Sta	mens as many as corolla lobes; herbs; fruit a capsule				
		5′	Sta	mens twice as many as corolla lobes; shrubs or trees; fruits fleshy.				
			6.	Fruit a berry; anthers dehiscent by terminal pores				
			6′	Fruit a winged drupe; anthers dehiscent by lateral slits				
	4 ′	Fila	amei	nts adnate to corolla tube or throat.				
		7.	Sta	mens 15 or more				
		7′	Sta	mens 9 or fewer.				
			8.	Plant a parasitic shrub, growing on the branches of woody hosts; stamens opposite the corolla lobes				
			8'	Plant terrestrial or epiphytic, never parasitic; stamens alternate with the corolla lobes.				
				9. Stamens fewer than corolla lobes.				
				10. Ovules several to many.				
				11. Plants herbaceous				
				11' Plants woody				
				10' Ovule 1.				
				12. Involucre present; inflorescence a dense bracteate head or spike				
				12' Involucre absent; inflorescence variously cymose, sometimes flowers solitary or clustered in heads.				
				13. Plants woody				
				13' Plants herbaceous				
				9' Stamens as many as corolla lobes.				
				14. Flowers imperfect, clustered in involucrate heads				
				14' Flowers perfect, inflorescences various.				
				15. Flowers 4-merous.				
				16. Ovary 1-loculed, 1-ovuled				

16′	Ovary 2-loculed with 1—many ovules in each locule or 1-loculed with several to many ovules
15' Flo	wers 5-merous.
17.	Stipules absent, or if present, small and attached to the petioles (rarely larger in plants with conspicuously bilabiate flowers and connate-perfoliate upper leaves); carpels 2–5
17′	Stipules present, often well developed, generally attached to the stem between the bases of the leaves; carpels seldom more than 2. RUBIACEAE—p. 372

Key 13-Monocots with Showy Flowers

1.	Gy	noe	ciun	n apocarpous; carpels more than 1, distinct to the base.	
	2. Plant a shrub or tree with large compound or deeply lobed leaves.				
	_,				
	2'			n aquatic or semiaquatic herb; leaves entire.	
				rts of perianth usually 2, rarely 1 or 3, petaloid	
		3′		rts of perianth 6, in 2 series, at least the inner whorl petaloid.	
			4.	Sepals green; petals white to purple; fruits usually 1–2 seeded, mostly indehiscent.	
			4 ′	Sepals and petals both pink; fruits several seeded, dehiscentBUTOMACEAE—p. 459	
1′				n monocarpous or syncarpous; ovary 1, simple or compound, sometimes deeply lobed but if always connate, at least toward the base.	
	5.	Ov	ary	superior.	
		6.	Inf	lorescence subtended by a well-developed spathe.	
			7.	Plant a shrub or tree; leaves large, compound or deeply lobed	
			7′	Plant an herb; leaves entire.	
				8. Plants aquatic or subaquatic, floating or rooted in shallow water.	
				8' Plants terrestrial	
		6′		lorescence without a well-developed spathe; leaves never compound or deeply lobed; plants t floating or submerged.	
			9.	Outer perianth segments distinctly different from the different from the inner, often green and sepaloid.	
				10. Leaves few, not overlapping or sheathing	
				10' Leaves many, overlapping or sheathing.	
				11. Ovules many in each locule; plants terrestrial or epiphytic; leaves often spinytoothed, often succulent; sap not viscid	
				11' Ovules 1 or few in each locule; plants terrestrial; leaves never spiny-toothed, seldom succulent.	
				12. Flowers sessile in a spike or head; fertile stamens usually 3.	
				12' Flowers peduncled in a cyme or umbel; fertile stamens usually 6	
			9′	Outer and inner perianth segments essentially alike, both whorls petaloid.	
				13. Plants xerophytic and/or woody; leaves mostly fibrous, sword-like, in dense basal or apical tufts; style simple; flowers commonly in large racemes or panicles.	
				14. Leaves very succulent but not strongly fibrous; sap often very slimy.	

	14' Leaves thickish but more leathery than fleshy, very tough and fibrous; sap not slimy.
	13' Plants not or only slightly xerophytic; leaves not strongly fibrous; style 1, often lobed or divided, or styles 3.
	15. Plant a vine with net-veined leaves
	15' Plant an herb with parallel-veined leaves
5 ′	Ovary inferior.
	16. Fertile stamen 1 (or 2); petaloid staminodes sometimes present.
	17. Stamen or stamens adnate to stigma and style forming a gynandrium or column; ovary usually twisted
	17' Stamen free from stigma and style; ovary not twisted.
	18. Anther 2-loculed; sepals connate into a sometimes spathelike tube
	18' Anther 1-loculed; sepals distinct or at most connivent.
	19. Ovules many in each locule; flowers large, mostly more than 5 cm long.
	19' Ovules 1 in each locule; flowers small, less than 2.5 cm long
	16' Fertile stamens 3 or more, none modified into petaloid staminodes.
	20. Plants aquatic, submerged or floating; ovules spread all over the inner surface of ovary; flowers mostly imperfect
	20' Plants terrestrial or epiphytic; ovules confined to placentae; flowers usually perfect.
	21. Segments of perianth in 2 obviously different series, the outer differing from the inner in size, shape or color.
	22. Petals dissimilar, or only 1; plants mostly large, sometimes treelike herbs.
	23. Leaves 2-ranked; fruit a capsule; flowers all perfect
	23' Leaves spirally arranged; fruit a berry; flowers functionally imperfect
	22' Petals essentially alike, 3 in number; plants usually not very large.
	24. Stamens 3; bracts usually green or membranous.
	25. Leaves equitant (vertically folded and fused with only "lower" surface exposed).
	25' Leaves dorsiventral (with a top and bottom side)LILIACEAE—p. 462
	24' Stamens 6.
	26. Leaves many, overlapping, usually more or less leathery and often spiny-toothed; flowers more than 1, usually with brightly colored bracts. BROMELIACEAE—p. 463

26' Leaves 2-3, not leathery or toothed; flower 1, with a single membranous bract
21' Segments of perianth all similar in size, shape and color.
27. Plant a vine with small inconspicuous flowers; leaves petiolate, net-veined.
27' Plant not a vine; flowers small to large and showy.
28. Stamens 3; leaves equitant (vertically folded and fused with only "lower surface" exposed)
28' Stamens 6 (rarely 3); leaves dorsiventral (with a top and bottom surface).
29. Ovary only partially inferior; small scapose herbs with linear leavesLILIACEAE—p. 462
29' Ovary wholly inferior.
30. Flowers several (1) in a scapose umbel subtended by 1 or more spathelike bracts; leaves thin, neither leathery nor fibrous.
30' Flowers many in large panicles, spikes or racemes; leaves thick, leathery, very fibrous

Key 14—Monocots with Small, Non-Showy Flowers

1.	1. Blades of leaves conspicuously expanded, pinnately or palmately veined, often lobed or compo							
	2.				leaflets very stiff, plicately folded; inflorescence a panicle subtended by a spathe.			
	2′	Lea	aves		t plicately folded; inflorescence a spadix (fleshy spike) subtended by a spathe			
1′		ides npo			es linear or narrowly lanceolate, or sometimes lacking, parallel veined, never lobed or atic, either submersed or floating, or barely raised above the water surface.			
	3.	Plants aquatic, either submersed or floating, or barely raised above the water surface.						
					body minute, less than 1 cm long, free-floating or stranded on mud, not differentiated into and leaves; roots, if present, unbranched			
4' Plant body much larger, differentiated into stems and leaves, usu					body much larger, differentiated into stems and leaves, usually rooted; roots branching.			
			5.		ants of marine habitats; flowers on one side of a flattened axis.			
			5′	Pla	ants of fresh or brackish waters; flowers solitary or in spikes.			
				6.	Leaves opposite or whorled.			
					7. Leaves with free membranous stipules, entire; gynoecium apocarpous; fruits beaked			
					7' Leaves estipulate (although base somewhat auriculate); gynoecium a single pistil with 3–4 stigmas; fruit beakless			
				6 ′	Leaves alternate or basal.			
					8. Flowers imperfect, clustered in heads			
					8' Flowers all perfect.			
					9. Fruits sessile on axis of spike; peduncles straight			
					9' Fruits stalked in umbelliform clusters; peduncles becoming spirally coiled in age			
	3′	Pla	nts	of la	and or shallow water; if semiaquatic, leaves and flowers well-emersed from water.			
		10.	Flo	wei	rs all imperfect in dense spikes or spherical heads 1–4 cm in diameter.			
			11.		owers in terminal spikes 10–30 cm long; pistillate flowers subtended by fine bristles.			
			11′	Flo	owers in spherical heads; pistillate flowers subtended by tiny chaffy scales			
		10'	Flo	wei	rs perfect, or if imperfect, inflorescence less than 1 cm in diameter.			
			12.	Gy	ynoecium apocarpous; ovaries 3–6, separating at maturity.			
				13	. Racemes bracteate; seeds 2 per ovary			
				13	' Racemes bractless; seed 1			
			12′	Gy	ynoecium monocarpous or syncarpous.			

- 14' Inflorescence of solitary flowers, panicles, spikes or spikelets; flowers perfect or imperfect.

 - 15' Fruit one-seeded, an achene or a caryopsis; perianth segments absent or reduced to bristles or minute scales.

 - 16' Long-styled naked pistillate flowers absent or borne in a dense spike; perfect flowers present) borne in spikelets; leaves often cauline, flattened to terete or reduced to bladeless scales.
